# Data Science at the Command Line

Igor Arambasic

# About myself...

- Data Scientist (10+ years)
- Project Manager (5+ years)
- Big Data (4+ years)

2002-2014@GAPS = Grupo de Aplicaciones de Procesado de Señal 2014-@AMADEUS

• PhD in Telecommunications Science, Universidad Politécnica de Madrid, 2008

# How did I end up at Amadeus?

- What do I do in Amadeus? ©
  - Scala, Spark, Scoobi, Python, Shell
  - SQL, Impala, Hive, Cassandra,
  - Hadoop, HDFS, Hue
  - Tableau, Qlik
  - Jenkins

### Data science

- Data science Practical definition by Mason & Wiggins (2010) in five steps:
  - (1) obtaining data,
  - (2) scrubbing data,
  - (3) exploring data,
  - (4) modeling data
  - (5) interpreting data.

• Together, these steps form the OSEMN model (which is pronounced as awesome).

### Data science

- In "Data Jujitsu: The Art of Turning Data Into Product" DJ Patil states that "80% of the work in any data project is in cleaning the data" (2012).
- Common scrubbing operations include:
  - Filtering lines
  - Extracting certain columns
  - Replacing values
  - Handling missing values
  - Converting data from one format to another

### What shell we learn here?

- Introduction to Data science @ Command line
- Command Line Environment, Tools types, Pipelining, Redirecting, Quoting...
- File utilities (ls, touch, find)
- Content utilities (cat, less, echo, head, tail)
- Sorting and counting utilities (sort, uniq, wc)
- Regular expressions
- Processing and filtering utilities (sed, grep, tr, cut )
- Working with compressed Files (tar, gz, bz2)
- Csv toolkit
- ... and a bunch of other unclassified commands...

# Data science @ Command line

• The command line itself was invented over 40 years ago.

- most command-line tools adhere the Unix philosophy:
  - Do only one thing, but do it really well !!!

- How can an old technology be of any use to a field that's only a few years young?
  - Its core functionality has largely remained unchanged,
  - But open source community is producing many free and high-quality command-line tools that we can use for data science.

# Data science @ Command line

Interesting fact...

- According to an article on Top 500 Supercomputer Sites, 95% of the top 500 supercomputers are running GNU/Linux.
- Microsoft is adding the native GNU/Linux command line to Windows 10
  - http://www.theverge.com/2016/3/30/11331014/microsoft-windows-linux-ubuntu-bash
  - http://www.howtogeek.com/249966/how-to-install-and-use-the-linux-bash-shell-on-windows-10/

# What is GNU/Linux?

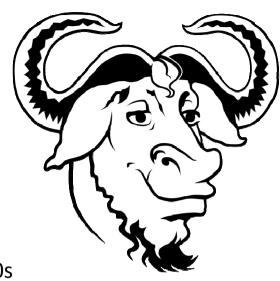

The environment of any Unix like system is roughly defined by four layer in this order from the top down:

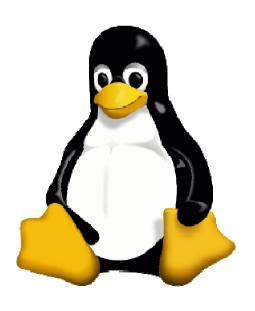

- 1) Command-line tools We use them by typing their corresponding commands.
- **2) Terminal** the application where we type our commands in.
  - Once we have typed in our command and pressed <Enter>, the terminal sends that command to the shell..
- 3) Shell program that interprets the command.
- 4) Operating system which is GNU/Linux in our case.
  - The heart of any Unix-like is kernel which allocates machine resources and talks to the hardware
  - We will also use GNU/Linux with GNU corresponding to system and Linux to its kernel

# What is GNU/Linux?

#### **UNIX vs GNU**

- Unix non-free operating system created by researchers for AT&T in the 1970s
- **GNU**: set out to create open source clone of Unix
  - GNU : recursive acronym for "GNU's Not Unix"
  - refers to free operating system with totally free tools

# What is GNU/Linux?

#### • GNU project:

- The development started in 1983 led by Richard Stallman
- The GNU project includes an operating system kernel, GNU HURD
- but this kernel was included in some Linux distribution for the first time in 2015 (Debian GNU/HURD 2015 distribution).
- Due to Hurd not being ready for production use, in practice these operating systems use **Linux kernel**. Hence the name **GNU/Linux**!
- **Linux kernel** was written in 1991 by <u>Linus Torvalds</u> as a hobby for his personal computer
  - Open source
  - received contributions from nearly 12,000 programmers from more than 1,200 companies

# Linux Distributions

- GNU/Linux forms the basis for the many distributions we know today, generically referred to as 'Linux'.
- A distribution is made by someone (**anyone**) by taking the main core of Linux (kernel) <u>and adding any tools</u>, programs, user interfaces, etc. they deem useful / preferable / or any other reason.
- Both Ubuntu and Debian are both distributions of Linux.
  - Ubuntu uses Debian as starting point
  - One major difference is Ubuntu Unity Desktop whereas Debian tend to install KDE desktop instead

https://upload.wikimedia.org/wikipedia/commons/1/1b/Linux\_Distribution\_Timeline.svg

# Done with Wiki Facts!!!

• Lets start with hands on session...

## Command Line Tools basics

- each command is usually preceded with a dollar sign (\$) or some other sign. In our case it is %. This is called the **prompt**.
- The prompt shows more information, namely
  - username (dsc)
  - Name of current directory (without any structure information)
  - current working directory under the home directory (~)
  - time

### • Lets try this:

- whoami
- echo Welcome to Master
- echo send argument to stdout

# Navigation through directories:

What is ~? Symbol representing your home directory Where are we now?

- pwd prints the name of the current directory
- Lets try this:
  - pwd
  - echo \$PWD

What is "\$" used for? Variable name is coming after me What if I do want to print \$ to screen? \\$

echo \\$PWD

### Command Line Tools basics

#### Which Linux are we using in our Virtual Machine?

- Distribution info: cat /etc/os-release
- cat— send contents of file to stdout
  - -n, --number : number all output lines
- Try this:
  - Inside /home/dsc/Data/shell/: cat Text\_example.txt
  - Inside /home/dsc/Data/shell/: cat -n Text\_example.txt
  - Inside /home/dsc/: cat Data/shell/Text\_example.txt
  - Inside /home/dsc/Data/opentraveldata/ : cat ../shell/Text\_example.txt
  - Inside /home/dsc/Data/opentraveldata/ : cat /home/dsc/Data/shell/Text\_example.txt
  - Inside /home/dsc/Data/opentraveldata/ : cat ~/Data/shell/Text\_example.txt

# Navigation through directories:

How do I move through directories?

cd = Navigation Command

- cd with NO arguments takes us to the users home directory
- / = root directory
- ./ = current directory
- ../ = upper (parent) directory
- ~ = user home directory
- - =toggle between the last two directories
- . =>hidden directories/files start with dot!

### How do we see what's inside the directory?

- Is prints the contents of the current directory
  - Blue= directory
  - Green=can be executed
  - White = text file

### Try this:

- Is
- Is -1
- |S -S
- Is -1 -s
- Is -1s
- Is -s1
- Is -IH

### How can I see the hidden files?

• . =>hidden directories/files start with dot!

### Try this:

• Is -a

### Can I get more information?

### Try this:

- |s -|
- Is -la
- Is -I .zshrc

#### • What do I see?

- 1. file permissions,
- 2. number of links,
- 3. owner name,
- 4. owner group,
- 5. file size,
- 6. time of last modification
- 7. file/directory name

### Can I sort the list?

### Try this:

- Is -S
- Is -ISr
- Is -It
- Is -ltX

### Meaning:

- -S : sort by file size
- -r, --reverse: reverse order while sorting
- -t : sort by modification time, newest first
- -X : sort alphabetically by entry extension

#### Can I change permissions?

- chmod change file read/write/execute permissions
  - ugo = user/group/other (special option a=all)
  - rwx= read/write/execute
  - user(rwx)/group(rwx)/other(rwx)-> 9 binary values
  - chmod 777 = chmod ugo+rwx -> 7=111

### Try this:

- chmod u+r,g+xw file\_name
- chmod u+r, g+xw file\_name
- chmod uo-r,g+xw file\_name

→ (NO space in chmod parameters!!!!)

### How do we create files/directories?

- mkdir make a directory
  - -p = make parent directories as needed
- touch creates an empty file
  - or updates the access and modification time of existing file

### Try this:

- mkdir one
- mkdir one/two/three
- mkdir –p one/two/three
- touch file

### How do we copy files/directories?

- cp copy a file/ directory
  - SINTAX: cp [options] source destination
  - -r : recursive mode used for directories
  - -i: interactive confirm file overwriting
  - -v : verbose see copy progress
  - -p: preserve the file permission and other attributes/metadata

#### Try this:

- cp -r source dir destination dir
- cp source\_file destination\_file
- cp -p source\_file destination\_file
- cp -i file\_1 file\_2 destination\_dir

### How do we move files/directories?

- **mv** move
  - -f, --force : ignore nonexistent files and arguments, never prompt
  - -r : recursive mode used for directories
  - -i: interactive confirm file overwriting
  - -v : verbose see copy progress

#### How do we rename files/directories?

- mv rename files/directory
  - -f, --force : ignore nonexistent files and arguments, never prompt
  - -r : recursive mode used for directories
  - -i: interactive confirm file overwriting
  - -v : verbose see copy progress

### NO, its not a mistake! Do NOT use rename!!!

- rename is used to change the name of multiple files.
- according to regular expression of perlexpr type.
- perlexpr is a regular expression as used by the Perl programming language.
- no, this is not a mistake...

### How do we delete files/directories?

- rm eliminate files. (Careful! No recycle bin in Unix!)
  - -f, --force : ignore nonexistent files and arguments, never prompt
  - -r : recursive mode used for directories
  - -i: interactive confirm file overwriting
  - -v : verbose see copy progress

However... did you notice files that end with ~? What could those be? Try this:

```
    touch test_file.txt
        chmod 777 test_file.txt
        ls -l test_file*
        kwrite test_file.txt
        ls -l test_file*
        emacs test_file.txt
        ls -l test_file.txt
```

Was this all necessary? Yes, in order to prove backups depend on the editor you are using!!

# File utilities - Quick exercises

- 1. Create a directory "first\_dir" in you home folder
- 2. Create an empty file "text\_file.txt" inside "first\_dir" directory.
- 3. Add execute permissions to group users, and write permissions to other users to "text\_file.txt"
- 4. Create 3 subdirectories inside "first\_dir": "sub1", "sub2", "text\_file"
- 5. Copy the "text\_file.txt" file into "sub1" directory.
- 6. Move the "text\_file.txt" into sub2 under name "text\_file.txt.2".
- 7. Copy the whole directory "sub1" to "sub3" directory.
- 8. Change file name of "text\_file.txt" file inside the "~/first\_dir /sub3" to "text\_file.txt.backup"
- 9. Change permissions of "text\_file.txt.backup" so that everyone has all permissions.
- 10. Move "text\_file.txt.backup" to "first\_dir" directory as hidden file
- 11. Delete the "sub3" subdirectory

# Command Line Tool types

#### Tools types:

- 1. binary executable (special type is shell builtin)
- 2. interpreted script
  - text file that is executed by a binary executable.
  - The script is interpreted correctly not because of the file extension, but because the first line of the script that specifies the binary that should execute it

#### 3. Alias

- simpler than shell functions as they don't allow parameters.
- If you often find yourself executing a certain <u>command with the same parameters</u>, you can define an alias for this.
- Aliases are also very useful when you continue to misspell a certain command (alias moer=more).
- To see all aliases currently defined, you simply run alias without arguments.

You can find out the type of a command-line tool with type.

- Where do I define alias?
- Type II
- Type Is
- How do I know what the hell am I executing?

# How to be sure U see what you think you U see?

#### Advice:

• In your scripts always use "./name\_of\_file" when executing file in current directory!

How to know which binary are you executing?

which

Try this: which Is

which python sudo which python

How to know the location of the binary?

- whereis
- locates the binary, source and manual files

### **Terminal**

### Once again.... what is Terminal?

application where we type our commands

### Does it run your commands?

- No, your terminal doesn't run bash commands on its own, it lets you communicate with the bash process that it runs
- It provides input (through connected input devices) and displays output on two channels: stdout and stderr.

# Shell

And once again.... what is Shell?

• a program that interprets the commands

Do all Linux distributions use the same shell?

• Of course NOT! This is free world you are free to chose your shell!

### Command Line Tools basics

Which shell are we using in our Virtual Machine?

• Shell info: echo \$0 → current shell

echo \$SHELL → default shell

- \$0 is the name of the running process.
- If you use it inside of a shell then it will return the name of the shell. If you use it inside of a script, it will be the name of the script
- \$SHELL is the default shell for the system (or user), which is usually (but not necessarily) the shell that is actually being used at any given moment

### Command Line Tools basics

Which shell applications do we have?

```
    Shell info: chsh -l or cat /etc/shells
chsh -s /bin/bash
chsh -s /bin/zsh
```

- The chsh command changes the user login shell. You must log out and log back in to see this change.
- Can I run one shell in another shell? Why not? Type bash

### **Terminal**

How to open new shell from the Terminal?

- CTRL+shift+n
- CTRL+shift+t

How to terminate the shell?

- Type exit or press CTRL+D
- CTRL+D= EOF = End of File

I didn't open a file!!! What does EOF have to do with any of this???

What does EOF have to do with any of this????

- Terminal implements a very simple line editor
  - where you can use Backspace to erase a character (for example)
- when an application reads from the terminal, it sees nothing until you press Return at which point the read() returns the full line
- EOF is a signal saying that this is the end of a text stream.
- Now, if the current line was empty, with CTRL+D the read() will return 0 character.
- You are telling it no more input is going to be coming, there's nothing more for the shell to do so it exits!

- ALT+b = move backward word by word
- ALT+f = move forward word by word

- CTRL + u cut/erase the whole line
- CTRL + k cut/erase line right
- CTRL + w cut/erase word left
- ALT + d cut/erase word right
- CTRL + y paste

- Highlightnig and pasting
  - CTRL+SHIFT+c
  - CTRL+SHIFT+v
  - Middle mouse key for paste

- CTRL + I clear screen
- CTRL + r block search
- ALT + c capitalise the first letter of the current or following word
- ALT + u change the rest of the current word or the following word to uppercase
- ALT + I change the rest of the current word or the following word to lowercase

- CTRL + I clear screen
- CTRL + r block search

### Command Line History

Where does the history from block search come from?

- "echo \$HISTFILE"
- ~/.history
- Command: history (-n) history -i
- Command line: up/down arrows
- Start typing + up/down arrows
- Ctrl-r -> block search through history

### Autocomplete

#### Autocomplete!!!

- Depends on the context (cd +tab vs cp +tab)
- Opens with tab
- Move through options with tab or arrows
- Select with enter
- Use it !!!

# Standard input/output and Redirecting

By default, the output of the last command-line tool in the pipeline is outputted to the terminal.

You can also save this output to a file with ">". This is called output redirection:

```
iaramba@localhost: ~ % seq 1 2 10 >temp.file
iaramba@localhost: ~ % cat temp.file
1
3
5
7
9
```

If this file does not exist yet, it is created. If this file already did exist, its contents would have been overwritten.

You can also append the output to a file with ">>", meaning the output is put after the original contents:

```
dsc: ~ % echo -n "Hello" > hello-world
dsc: ~ % echo " World" >> hello-world
dsc: ~ % cat hello-world
Hello World
```

### File utilities - Quick exercises

- 1. Go to your home directory
- 2. Use Text\_example.txt to generate a new file with the same content and line number at the beginning of each line.
- 3. Generate a new file with twice the content of "Text\_example.txt" inside. (one full text content after another)
- 4. Open new shell inside a new terminal tab and using block search execute again the command where we printed the linux details (hint: it had "release" in the name)

- wc print newline, word, and byte counts for each file
  - -c, --bytes : print the byte counts
  - -m, --chars : print the character counts
  - -l, --lines : print the newline counts
  - -w, --words : print the word counts

- cat Text\_example.txt | wc
- cat Text\_example.txt | wc -l
- wc Text\_example.txt

- head show first lines of file
  - -c K : print the first K bytes of each file;
    - with K negative, print all but the last K bytes of each file
  - -n K: print the first K lines instead of the first 10;
    - with K negative, print all but the last K lines of each file
- Lets try this (inside ~/Data/opentraveldata ):
  - head -c 1K optd\_aircraft.csv | wc
  - head -n 3 optd\_aircraft.csv
  - head optd\_aircraft.csv
  - head -n -450 optd\_aircraft.csv
  - head -3 optd\_aircraft.csv

- tail— show last lines of file
  - -c K: output the last K bytes;
    - or use -c +K to output bytes starting with the Kth of the file
  - -n K: output the last K lines
    - use -n +K to output starting with the Kth line
  - -f: output appended data as the file grows;
- Lets try this (inside ~/Data/opentraveldata):
  - tail -3 optd\_aircraft.csv
  - tail -c -1k optd\_aircraft.csv | wc
  - tail —n -1 optd\_aircraft.csv optd\_airlines.csv optd\_por\_public.csv
  - cat -n optd\_aircraft.csv | tail -n +450
  - find / -name "\*.txt" -exec ls -l {} \; -exec sleep 3 \; > find\_file.txt & tail -f -n 3 find\_file.txt

#### less – show contents of a file, interactively

- -N: Causes a line number to be displayed at the beginning of each line in the display.
- -S: lines longer than the screen width are truncated rather than wrapped.
  - The default is to wrap long lines; that is, display the remainder on the next line.

#### Use this while reading:

- G/g: go to end/beginning of file
- q to quit
- Forward Search="/"
- Backward Search="?"
- Interactive search pattern:
  - ^pattern : pattern is at the beginning of line
  - pattern\$: pattern is at the end of line

n – for next match in search direction

N – for previous match opposite search direction

# Help utilities

- man short for manual
  - not every command has its manual
- Sometimes command line tools lack a man page. In that case, your best bet is to invoke the tool with the -h or --help option.
- Lets try this:
  - man bash
  - man Is
  - cat --help

How do I control man reader? man uses less!

### Content utilities - Quick exercises

- 1. Print first 3 lines of ~/Text\_example.txt
- 2. Print content of ~/Text\_example.txt except first 2 and last 3 lines.
- 3. Go to data/shell/ directory and use less to open Finn.txt
  - a) locate the lines starting with "The"
  - b) Locate the lines ending with "works"
- 4. Open ~/Data/opentraveldata/optd\_aircraft.csv with less command. Search for "Canada" and then search for "Puma"
- 5. How many lines does ~/Data/opentraveldata/optd\_aircraft.csv file have?
- 6. Use help to find out how to get the list of subdirectories limited to 2 sublevels by using "tree" command

### OMG I lost THE file!!!!

- BUT I know it's saved somewhere...
- BUT I am sure I downloaded it last week...
- I know the name starts with....
- I know it was mp3 extension

• • •

- **find** search for files in a directory hierarchy.
  - SINTAX: find [path] [conditions]
  - -type: f=file, d=directory
  - -name : find file by name
  - -iname : find file by name ignoring case

- find . -name "text\_file\*"
- find -name "tExt file\*"
- find -iname "tExt\_file\*"
- find -type d -name "text\_file\*"
- find -type f -name "text\_file\*"

- **find** search for files in a directory hierarchy.
  - -maxdepth: max levels of directories below the starting-points
    - 1 is current directory, 0 is the command line
  - -mindepth : min levels of directories below the starting-points
  - -perm p: the file's access mode is p (where p is an integer)
  - -not: inverting the match (exclamation can also be used "!" for inverting the match)

- find -maxdepth 5 -type f -name "text\_file\*"
- find -type f -name "text\_file\*"-maxdepth 5 => error
- find -maxdepth 5 -type f -perm 777 -name "text\_file\*"
- find -maxdepth 5 -type f! -perm 777 -name "text\_file\*"

- find search for files in a directory hierarchy.
  - --size n : file is of size n, +/-n = larger/smaller than n
  - -empty : find empty files

- find -maxdepth 1 -empty
- find -maxdepth 1 -not -empty
- find -maxdepth 1 -! -empty
- find ./Data -size +10M
- find -maxdepth 2 -size -1k

- find search for files in a directory hierarchy.
  - -mmin -N: find the files which are modified within N minutes
  - -mtime -N : find the files which are **modified** within N days

- find . -mmin 60
- find . -mmin -60
- find . -maxdepth 1 -mtime -1
- find . -maxdepth 1 -mtime -1 -! -name ".\*"

- find search for files in a directory hierarchy.
  - -exec cmd: execute command cmd on a file
  - -ok cmd: prompt before executing the command cmd on a file
  - After the command you should put "{} \;" (there is a space between "{}" and "\;")
    - For each result, command {} is executed.
    - All occurences of {} are replaced by the filename.
    - ; is prefixed with a slash to prevent the shell from interpreting it.

- find -maxdepth 5 -type f -name "text\_file\*" -exec ls -l {} \;
- find -maxdepth 5 -type f -name "text\_file\*" -ok ls -l {} \;
- find -maxdepth 5 -type f -name "text\_file\*" -exec echo "FOUND IT!!!" \;
- find -maxdepth 5 -type f -name "text\_file\*" -exec ls -l {} \; -exec head -2 {} \;
- find -maxdepth 5 -type f -name "text\_file\*" -ok rm -r {} \;

### But...

• How can you remember all these options???

• USE help!!!

• Or... use... <a href="http://lmgtfy.com/?q=ls+sort+by+date+descending">http://lmgtfy.com/?q=ls+sort+by+date+descending</a>

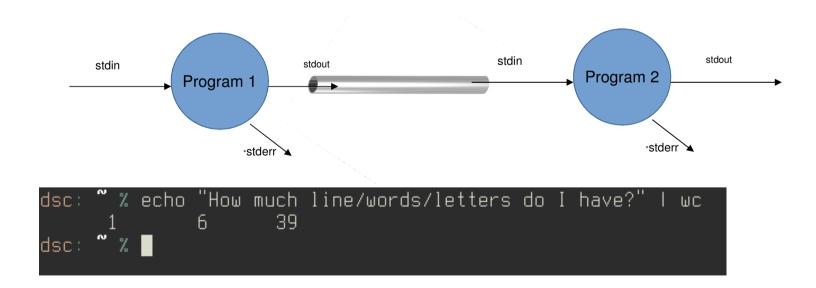

### File utilities - Quick exercises

- 1. Find all files located ONLY inside subdirectories of your home directory which have been modified in last 60min
- 2. Find all empty files which do NOT have read-write-excute permissions given to all users
- 3. Expand previous command to grant these permissions using "ok cmd" option.

Ready for more of Linux Concepts?

### The pipe

- The most common way of combining command-line tools is through a so-called pipe.
- The output of a command-line tool is by default passed on to the terminal, which displays it on our screen.
- We can pipe the output of one command to the input of the second tool by using "|"

### The really long pipeline

- Sometimes we use commands and pipelines that are too long to fit on the page.
- A long command can be broken up with either a backslash (\) or a pipe symbol (|).

- The greater-than sign (>) is the continuation prompt, which indicates that this line is a continuation of the previous one. Be sure to first match any quotation marks (" and ').
- The following command is exactly the same as the previous one:

```
dsc: ~ % echo "Hello world" | wc
1 2 12
```

# Standard input/output and Redirecting

By default, the output of the last command-line tool in the pipeline is outputted to the terminal.

You can also save this output to a file with ">". This is called output redirection:

```
dsc: ~ % seq 1 2 100 | grep 3 |tail -2 >new_file
dsc: ~ % cat new_file
83
93
```

If this file does not exist yet, it is created. If this file already did exist, its contents would have been overwritten.

You can also append the output to a file with ">>", meaning the output is put after the original contents:

```
dsc: ~ % echo –n "Hello" > hello—world
dsc: ~ % echo " World" >> hello—world
dsc: ~ % cat hello—world
Hello World
```

# Standard input/output and Redirecting

< - takes stdin from file

```
2& dsc: ~1 % wc -l < hello-world
2
2& dsc: ~ % <hello-world wc -l
2
dsc: ~ % wc -w hello-world
2 hello-world
```

This way you are directly passing the file to the standard input of wc without running an additional process.

The same can be achieved if the tool accepts files as command line arguments:

```
dsc: ~ % cat hello-world | wc -w
2
```

The third option includes additional tool that read the file and pipes it to wc:

### Quoting

- ' ' Single quotes: do not touch this text
- " Double quotes: Perform shell variable expansion
- ``- evaluate and replace (command substitution)
  - Be careful!!! `IS NOT EQUAL TO '
  - `\$(command)

```
dsc: ~ % echo 'My home directory is $HOME'
My home directory is $HOME
dsc: ~ % echo "My home directory is $HOME"
My home directory is /home/dsc
dsc: ~ % echo "date"
date
dsc: ~ % echo 'date'
date
dsc: ~ % echo `date`
Thu Mar 24 22:21:03 CET 2016
dsc: ~ % echo "$(date)"
Thu Mar 24 22:21:20 CET 2016
dsc: ~ % echo '$(date)'
$(date)
```

# Pipe- Quick exercises

- 1. How many words do first 5 lines of the Finn.txt have
- 2. Save the information of 3 largest file inside your home directory into a file. (hint: use Is with sort option and pipe the result)

# Finished for today ©

- Lets save all the commands we used today in one file
  - cat -n ~/.history >~/20170325\_commands.txt
- Can I just save commands from today?
  - history -id -1000 | grep "2017-03-25" > just\_2017-03-25\_commands.txt
